

Performance characteristics

Supports asynchronous and synchronous motors

It supports speed control for three-phase asynchronous motors and three-phase permanent magnet synchronous motors.

Optimized PID controller

It features a built-in advanced PID controller, making it particularly suitable for applications requiring constant pressure, flow rate, or temperature (such as constant pressure water supply and ventilation systems). It automatically adjusts the output frequency based on actual feedback values to achieve precise control.

Outstanding energy-saving characteristics

Sleep/Wake-up Function : When demand is low (such as at night), the inverter can automatically stop running and automatically start when demand recovers, further saving energy.

Powerful protection features

- Provides comprehensive protection for motors and Frequency Inverters, such as overcurrent, overvoltage, undervoltage, overheating, short circuit, motor stall, and motor overload.
- For pump applications, it provides a broken pipe protection, which can prioritize water supply in emergency situations.

Flexible I/O interfaces and communication capabilities

- It provides standard analog and digital input/output terminals, which can be connected to various sensors and control signals.
- With built-in Modbus RTU fieldbus communication protocol, it can be easily integrated into existing automation systems.
- It offers a variety of optional fieldbus adapter cards (such as Profibus-DP, EtherCAT, etc.) to expand communication flexibility.
