Shading systems

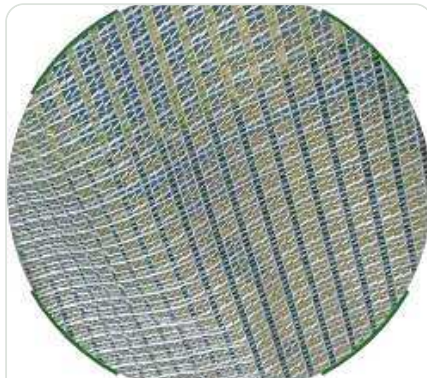

13

Shading reduces the solar load, cools the greenhouse and creates a more comfortable climate for the crop. Screens can be fitted outside the roof, inside the house, or both.

Inside shading

Screens run under the roof to cut heat and glare, and double as an energy screen on cold nights.

Shading screen

Knitted aluminium and polyester screens reflect sunlight and keep the house cooler.

Rack-and-pinion drive

A steel framework with motor-driven rack and pinion opens and closes the screens.

The result: less irrigation, a longer harvest window, better yields and higher fruit quality.
