Cooling systems

15

Fan-and-pad cooling draws outside air through wet pads and exhausts the excess heat, keeping the greenhouse temperature stable and under control.

Exhaust fans

Large wall fans pull air through the house and push hot air out.

Evaporative cooling pads

Water runs over cellulose pads; air drawn through them cools as the water evaporates.

How fan-and-pad cooling works

Pads on one wall and fans on the opposite wall pull cool air across the crop and exhaust the heat.

Why it matters: on hot days a well-designed cooling system keeps temperatures stable, reduces plant stress and keeps growth on track.
