

DLLF automatic disc filter

DISC FILTER

Secondary filtration for drip and micro-irrigation. Stacked grooved discs catch fibrous and soft impurities especially well, and the battery backwashes itself one unit at a time so water keeps flowing.

- Automatic backwash, with water supply continuing while it flushes
- High filtration precision in a compact, flexible assembly
- Removes inorganic impurities (sand, sediment) and organic impurities (seeds, algae, floating debris)
- Disc heads in high-pressure reinforced fibreglass with a Victaulic clamp for easy opening
- Polypropylene disc elements in a cylindrical filter body for reliable filtration
